# Azure Deployment Stacks
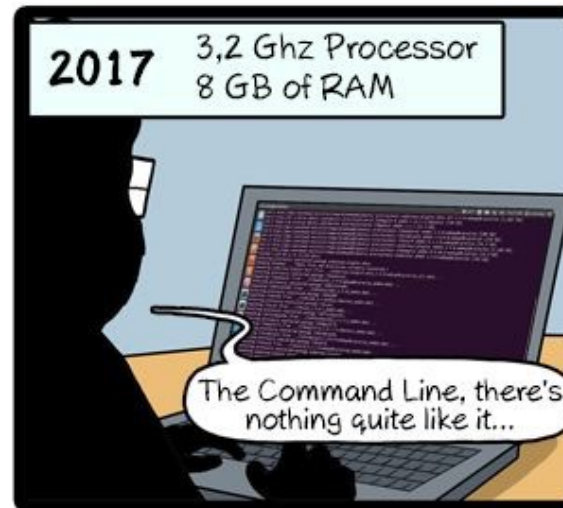

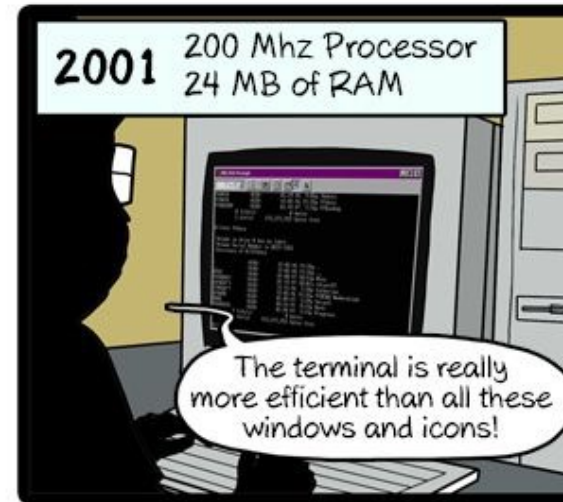

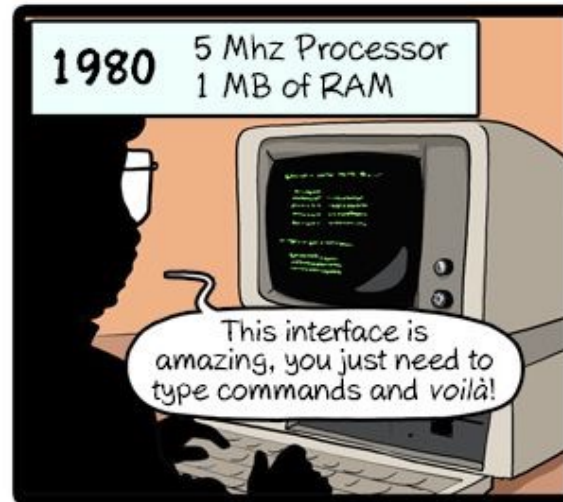

Wat zijn deployment stacks

- Betere manier om resources te deployen
  - State management
  - Resource protection

CommitStrip.com

Migratie van az deployment

```
az deployment group create
-g {resourceGroup}
--name {deploymentName}
--template-file {bicepPath}
```

```
az stack group create
-g {resourceGroup}
--name {stackName}
--template-file {bicepPath}
--deny-settings-mode None
--yes
```

Migratie van powershell

```
AzResourceGroupDeployment              Set-AzSubscriptionDeploymentStack

-ResourceGroupName {resourceGroup}     -DeploymentResourceGroupName {resourceGroup}

-Name {deploymentName}                 -Name {stackName}

-TemplateFile {bicepPath}              -TemplateFile {bicepPath}

                                       -DenySettingsMode None
```

Deployment stacks - cheat sheet

```
az stack [mg|sub|group] create –g {resourceGroup} –name {stackName} --template-file {bicepPath} --deny-settings-mode [none|denyDelete|denyWriteAndDelete] --yes
```

Deleting instead of detaching

Resources: --delete-resources true

Resource groups: --delete-resource-groups true

Both: --delete-all true

!! Stacks cannot delete keyvault secrets. Use Detach mode if a secret is no longer in a bicep template

Working with templates

Template file: --template-file

Template url: --template-uri

Predeployed template: --template-spec

Passing param file: --parameters {path to param file}

Passing param cli: --parameters KEY=VALUE KEY=VALUE

--deny-settings-excluded-principals "{p1} {p2}"

Allows specific principals to still perform delete and modify actions even if the deny mode does not allow it. Max 5

!! For service principals use the <u>objectId</u> of the <u>enterprise application</u>

Public preview

- Stacks zijn in public preview sinds:

  26 Jul 2023
